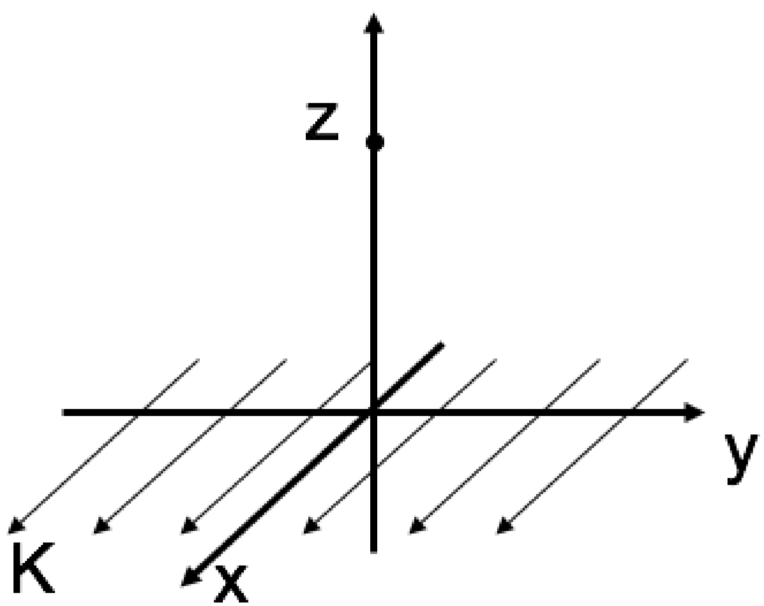
Consider the B-field a distance z from a current sheet (flowing in the +x-direction) in the z = 0 plane. The B-field has:



A. y-component only
B. z-component only
C. y and z-components
D. x, y, and z-components
E. Other

I will be in class on Wednesday.

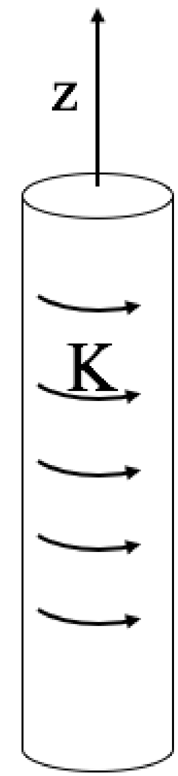
A. Yup
B. Nope, hoss, I'll be out.

js

An infinite solenoid with surface current density K is oriented along the z-axis. To use Ampere's Law, we need to argue what we think $\mathbf{B}(\mathbf{r})$ depends on and which way it points.

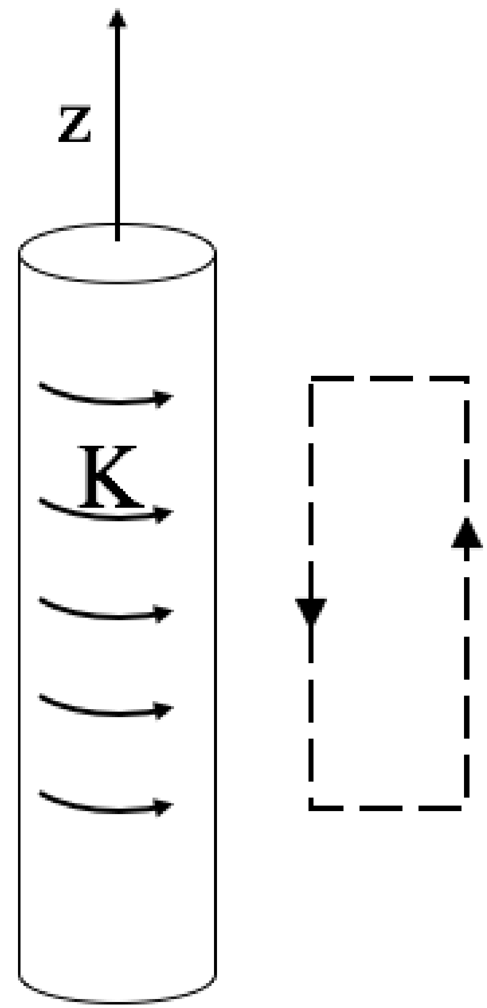
For this solenoid, $\mathbf{B}(\mathbf{r}) =$

A. $B(z)\,\hat{z}$
B. $B(z)\,\hat{\phi}$
C. $B(s)\,\hat{z}$
D. $B(s)\,\hat{\phi}$
E. Something else?

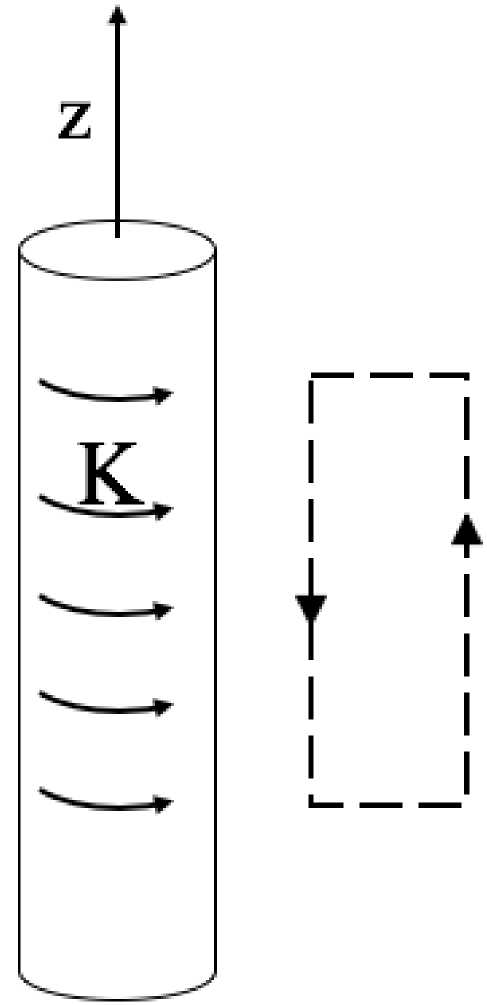


An infinite solenoid with surface current density K is oriented along the z-axis. Apply Ampere's Law to the rectangular imaginary loop in the yz plane shown. What does this tell you about B_z, the z-component of the B-field outside the solenoid?

A. B_z is constant outside
B. B_z is zero outside
C. B_z is not constant outside
D. It tells you nothing about B_z



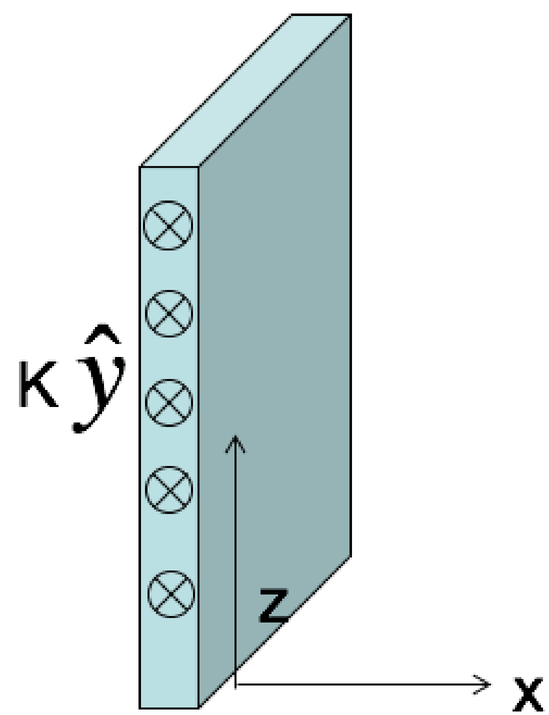
An infinite solenoid with surface current density K is oriented along the z-axis. Apply Ampere's Law to the rectangular imaginary loop in the yz plane shown. We can safely assume that $B(s \to \infty) = 0$. What does this tell you about the B-field outside the solenoid?



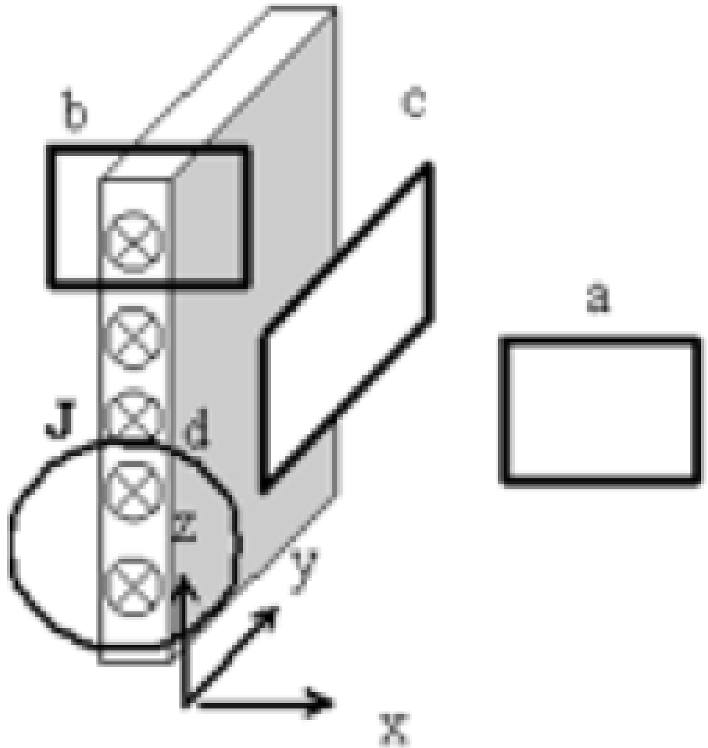
A. $|\mathbf{B}|$ is a small non-zero constant outside
B. $|\mathbf{B}|$ is zero outside
C. $|\mathbf{B}|$ is not constant outside
D. We still don't know anything about $|\mathbf{B}|$

What do we expect $\mathbf{B}(\mathbf{r})$ to look like for the infinite sheet of current shown below?

A. $B(x)\hat{x}$
B. $B(z)\hat{x}$
C. $B(x)\hat{z}$
D. $B(z)\hat{z}$
E. Something else



Which Amperian loop are useful to learn about $B(x, y, z)$ somewhere?



E. More than 1
