

We usually choose  $V(r \rightarrow \infty) \equiv 0$  when calculating the potential of a point charge to be  $V(r) = +kq/r$ . How does the potential  $V(r)$  change if we choose our reference point to be  $V(R) = 0$  where  $R$  is close to  $+q$ .

- A.  $V(r)$  higher than it was before
- B.  $V(r)$  is lower than it was before
- C.  $V(r)$  doesn't change ( $V$  is independent of choice of reference)

# ELECTROSTATIC POTENTIAL ENERGY

Consider slowly moving a positive charge from a location of low electric potential to one of high electric potential. What is the sign of the work done by you ( $W_u$ )? What is the sign of the work done by electric field ( $W_f$ )?

- A.  $W_u < 0$ ;  $W_f > 0$
- B.  $W_u < 0$ ;  $W_f < 0$
- C.  $W_u > 0$ ;  $W_f > 0$
- D.  $W_u > 0$ ;  $W_f < 0$

Three identical charges  $+q$  sit on an equilateral triangle. What would be the final  $KE$  of the top charge if you released it (keeping the other two fixed)?

- A.  $\frac{1}{4\pi\epsilon_0} \frac{q^2}{a}$
- B.  $\frac{1}{4\pi\epsilon_0} \frac{2q^2}{3a}$
- C.  $\frac{1}{4\pi\epsilon_0} \frac{2q^2}{a}$
- D.  $\frac{1}{4\pi\epsilon_0} \frac{3q^2}{a}$
- E. Other

Three identical charges  $+q$  sit on an equilateral triangle. What would be the final  $KE$  of the top charge if you released *all three*?

- A.  $\frac{1}{4\pi\epsilon_0} \frac{q^2}{a}$
- B.  $\frac{1}{4\pi\epsilon_0} \frac{2q^2}{3a}$
- C.  $\frac{1}{4\pi\epsilon_0} \frac{2q^2}{a}$
- D.  $\frac{1}{4\pi\epsilon_0} \frac{3q^2}{a}$
- E. Other

Does system energy "superpose"?

That is, if you have one system of charges with total stored energy  $W_1$ , and a second charge distribution with  $W_2$ ...if you superpose these charge distributions, is the total energy of the new system simply  $W_1 + W_2$ ?

A. Yes

B. No

Two charges,  $+q$  and  $-q$ , are a distance  $r$  apart. As the charges are slowly moved together, the total field energy

$$\frac{\epsilon_0}{2} \int E^2 d\tau$$

- A. increases
- B. decreases
- C. remains constant

A parallel-plate capacitor has  $+Q$  on one plate,  $-Q$  on the other. The plates are isolated so the charge  $Q$  cannot change. As the plates are pulled apart, the total electrostatic energy stored in the capacitor:

- A. increases
- B. decreases
- C. remains constant.
