Given the two diff. eq's :

$$\frac{1}{X}\frac{d^2X}{dx^2} = C_1 \qquad \frac{1}{Y}\frac{d^2Y}{dy^2} = C_2$$

where $C_1 + C_2 = 0$. Given the boundary conditions in the figure, which coordinate should be assigned to the negative constant (and thus the sinusoidal solutions)?

A. x
B. y
C. $C_1 = C_2 = 0$ here
D. It doesn't matter.

ANNOUNCEMENTS

- Exam 1 graded
  - Returned at the end of class today (Avg. 73; Median. 76)
- Sent out individual grade reports on Saturday
  - Please check that your grades make sense to you!
- Homework 5 is due on Friday
  - It's a bit longer...start early!

When does $\sin(ka)e^{-ky}$ vanish?

A. $k = 0$
B. $k = \pi/(2a)$
C. $k = \pi/a$
D. A and C
E. A, B, C

Suppose $V_1(r)$ and $V_2(r)$ are linearly independent functions which both solve Laplace's equation, $\nabla^2 V = 0$.

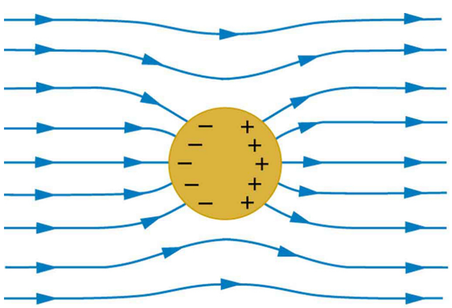
Does $aV_1(r) + bV_2(r)$ also solve it (with a and b constants)?

A. Yes. The Laplacian is a linear operator
B. No. The uniqueness theorem says this scenario is impossible, there are never two independent solutions!
C. It is a definite yes or no, but the reasons given above just aren't right!
D. It depends...

What is the value of $\int_0^{2\pi} \sin(2x)\sin(3x)\; dx$?

A. Zero
B. π
C. 2π
D. other
E. I need resources to do an integral like this!

SEPARATION OF VARIABLES (SPHERICAL)



Given $\nabla^2 V = 0$ in Cartesian coords, we separated $V(x, y, z) = X(x)Y(y)Z(z)$. Will this approach work in spherical coordinates, i.e. can we separate $V(r, \theta, \phi) = R(r)\Theta(\theta)\Phi(\phi)$?

A. Sure.
B. Not quite - the angular components cannot be isolated, e.g., $f(r, \theta, \phi) = R(r)Y(\theta, \phi)$
C. It won't work at all because the spherical form of Laplace's Equation has cross terms in it (see the front cover of Griffiths)
